

TURBIDITY CURTAIN

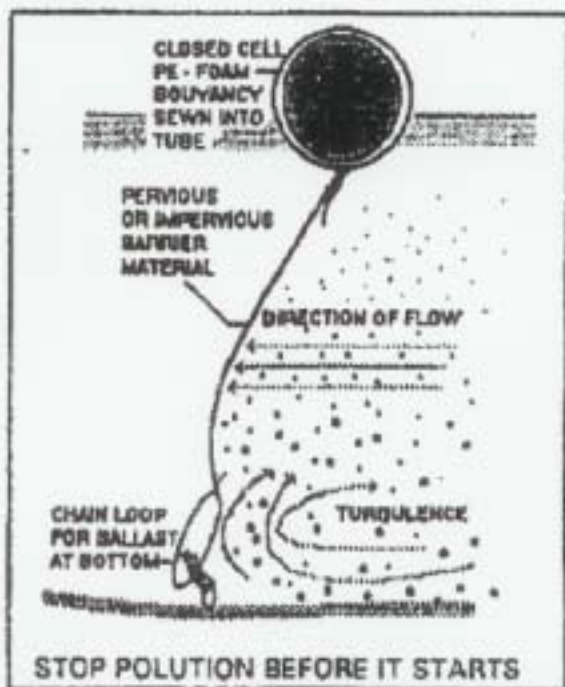

PROTECTING OUR ENVIRONMENT...

Turbidity curtains prevent the migration of silts or debris from construction sites near water. Turbidity curtains help settle silts in sedimentation ponds and prevent the mixing of clear and turbulent waters.

- control silt
- speed particle settlement

USES

- soil work near water
- treatment pond barriers
- sediment pond barriers
- catch floating debris

Each turbidity curtain has a floating boom, a barrier fabric or membrane, and a ballasting pocket with or without chain installed as ballast. Ready to deploy units come in 50' or 100'. Accessories allow additional anchoring when needed and end grommets allow units to be interconnected to span areas several hundred feet.

Cormier Turbidity Curtains are made with pervious geotextile barriers or impervious membranes. (See Table 2). Site specific barrier materials are available on request. Custom fabrications are welcome.
